

Geographical and social overview

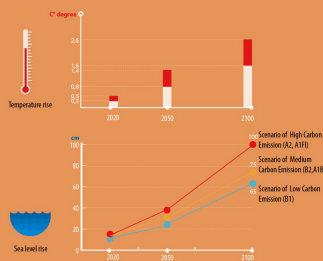

Agricultural and aquaculture - accounting for 75% of the people's livelihood in the Mekong Delta - depend greatly on weather land and water. Hence, these livelihoods are most vulnerable to the impacts of climate change.

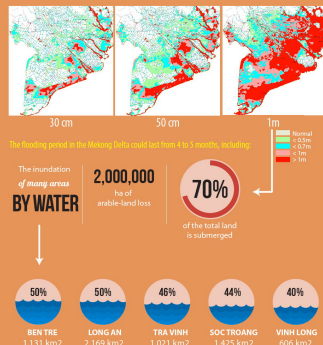

The impacts on environment

The Mekong Delta has a low and flat topography, of which most is at an altitude of 0.7-1.2 metres above MSL. Under the impacts of climate change, the Delta is now threatened by sea level rise, together with high tides and salinization.
